

Title: Statewide Department of Transportation Response to Climate Change Policies

Abstract: This project involves taking a look at state level Department of Transportation policies that effect our climate. The purpose of this research is to show where there are information gaps in transportation climate change policies and illuminate which states are strong leaders in reforming transportation departments for the betterment of our environment. The research done on each state is separated into three separate categories of tangible projects, future policy plans, and federal workshops for individual states. Each grouping is assigned a value and will be shown separately as well as combined with the other categories using Geographic Information Systems. This will help make the impact transportation has on climate change and every state's response to this crisis easy to understand.
