## Objective 1.8

---

- Students will find the distance between two points and the midpoint of a segment in the coordinate plane.

## Essential Question

How do you find the distance between two points?  
How do you find the midpoint of a segment ?

---

# Vocabulary

---

- ❑ **Coordinate plane:** Plane where two number lines intersect at a 90 degree angle.
  - ❑ **Quadrants:** Each one of the four sections in the coordinate plane. Named
  - ❑ **X-axis:** horizontal number line.
  - ❑ **Y-axis:** vertical number line
  - ❑ **Ordered Pair:** Coordinates of a point on a coordinate plane.  $(x, y)$
-

# The Distance Formula

---

- The distance  $d$  between two points  $A(x_1, y_1)$  and  $B(x_2, y_2)$  is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

---

# Example 1 Page 54 TE

---

- Luisa takes the subway from Oak Station to Jackson Station each morning. Oak Station is 1 mi west and 2 mi south of City Plaza. Jackson Station is 2 mi east and 4 mi north of City Plaza. How far does she travel by subway?
-

**6.7082 mi**

## Example 1b

---

Symphony Station is 1mi east and 2 mi north of City Plaza and Elm Station is 3 mi west and 6 mi south of City Plaza. How far is Symphony Station from Elm Station?

---

# The Midpoint formula

---

The coordinates of the midpoint  $M$  of  $\overline{AB}$  with endpoints  $A(x_1, y_1)$  and  $B(x_2, y_2)$  are the following

$$M = \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$$

---

## Example 2 page 55 TE

---

- Find the coordinates of the midpoint  $M$  of  $QS$  with endpoints  $Q(3,5)$  and  $S(7,-9)$

$$M(5,-2)$$

---

## Problem 2b page 55 TE

---

- Find the coordinates of the midpoint  $M$  of  $AB$  with endpoints  $A(2, -5)$  and  $B(6, 13)$

**$M(4, 4)$**
